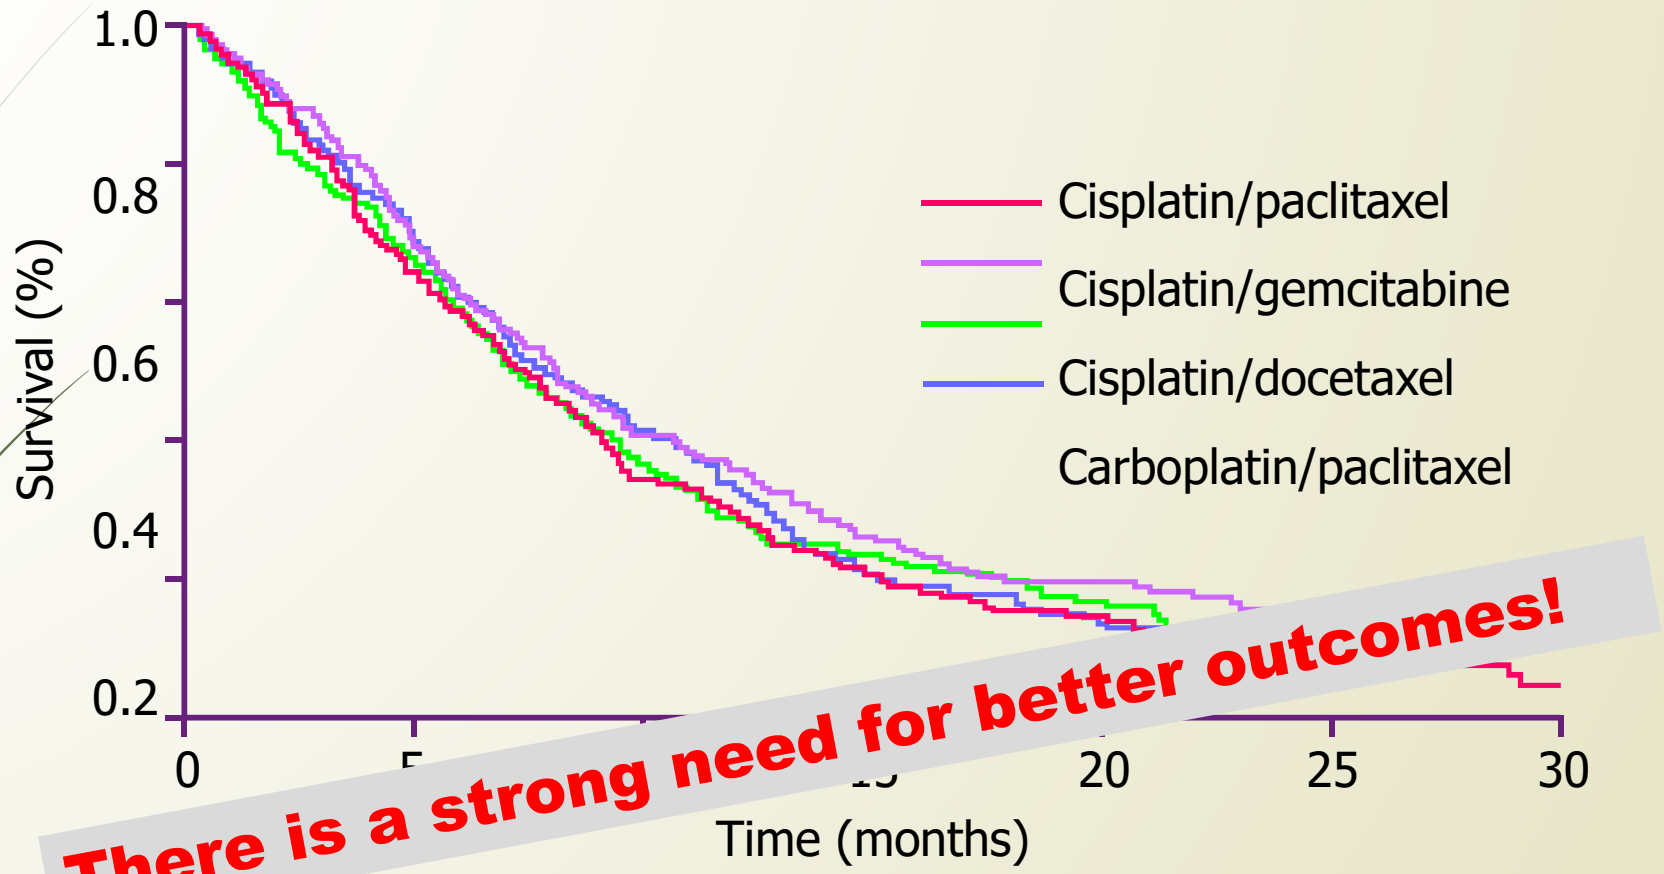
*Excludes basal cell and squamous cell skin cancers and in situ carcinoma except urinary bladder.

Most patients end up with advanced disease, and treated with systemic therapy

טיפולים כימותרפיים- תחילת 2000



Schiller JH, et al. N Engl J Med 2002;346:92–8

Two subtypes of NSCLC patient

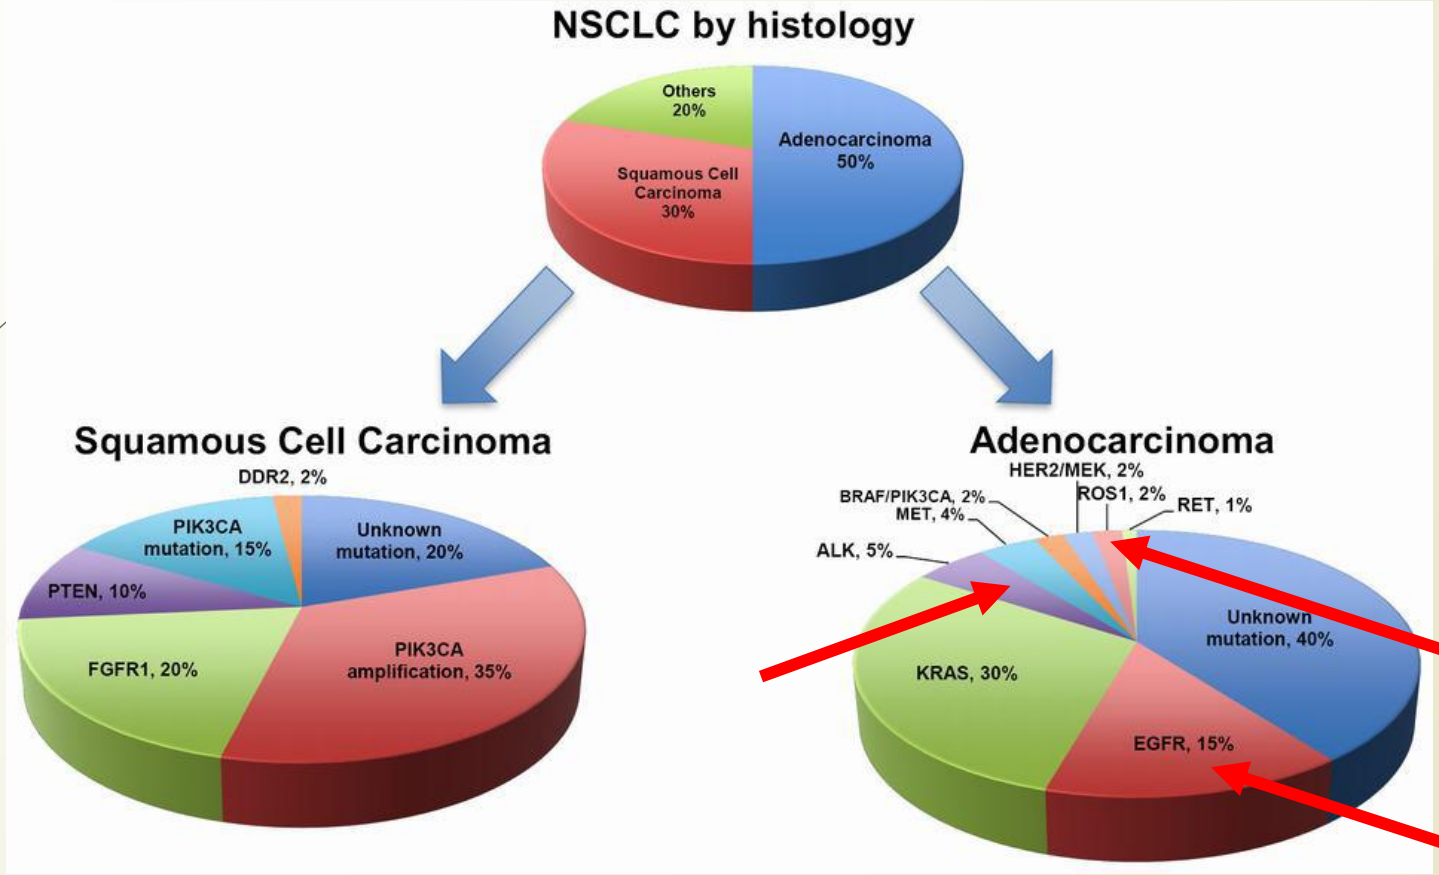
20%

80%

?

For those patients- tissue is the issue!

What are the common targets in Adenocarcinoma of the Lung?

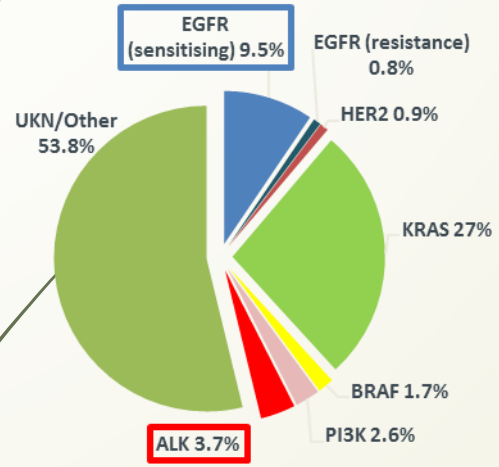


EGFR = epidermal growth factor receptor
ALK = anaplastic lymphoma kinase

ALK characteristics

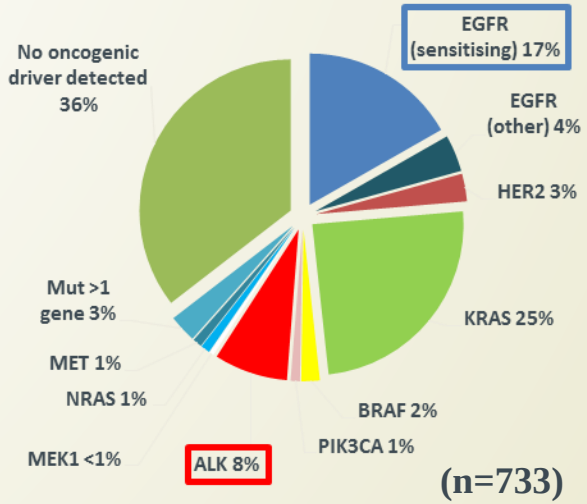
- Incidence of *ALK*+ NCSLC is Relatively Uniform across Ethnicities

Europe[1]
All histology



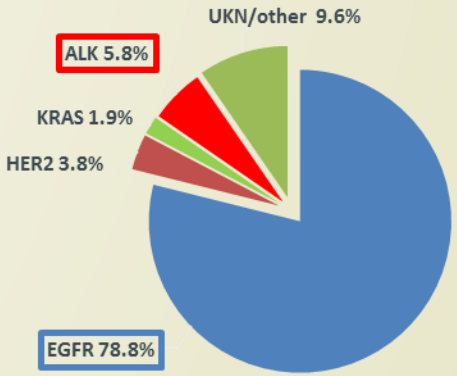
(n=9,911)

US[2]
Adenocarcinoma



(n=733)

East Asia[3]
Adenocarcinoma, never smokers



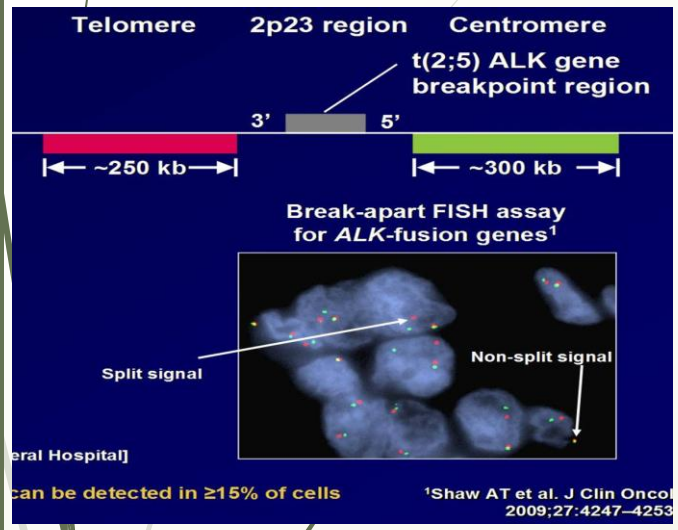
(n=52)

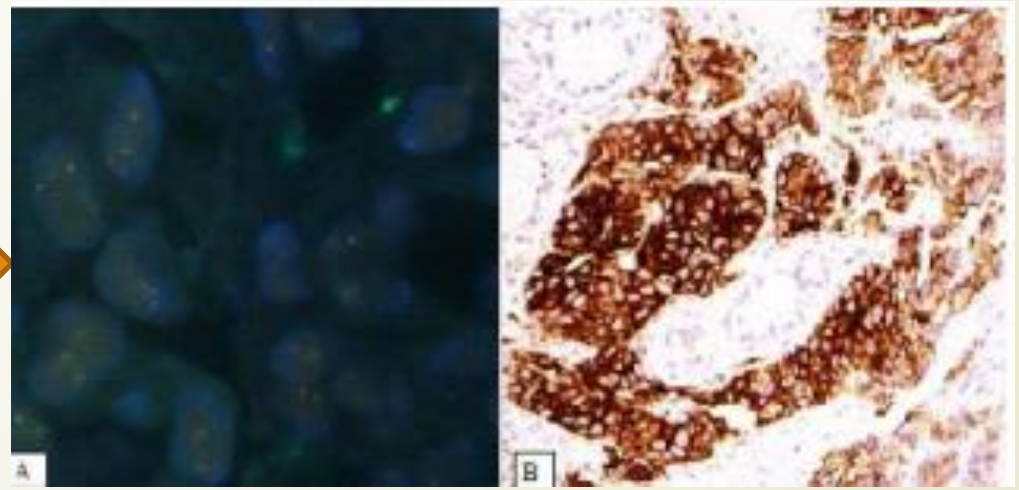
- *Younger and more male patients*
- Higher incidence of thrombo-embolic events

Barlesi, et al. ASCO 2013; 2. Johnson, et al. ASCO 2013; 3. Sun, et al. J Clin Oncol 2010

Zer, A., Moskovitz, M., Hwang, D.M., Hershko-Klement, A., Fridel, L., Korpanty, G.J., Dudnik, E., Peled, N., Shochat, T., Leighl, N.B. and Liu, G.,Shepherd F, 2017. ALK-Rearranged Non–Small-Cell Lung Cancer Is Associated With a High Rate of Venous Thromboembolism. Clinical lung cancer, 18(2), pp.156-161.

How to diagnose ALK Rearrangement?



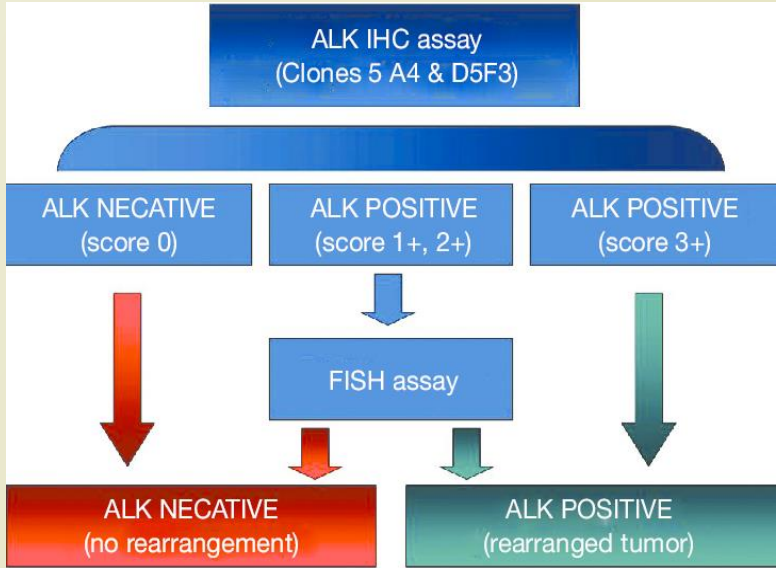


FISH break-apart test-

- Used to be the gold standard, but…
- Expensive
- Time consuming
- On some studies- missed up to 50% of ALK rearrangements compare to IHC and NGS

Immunohistochemistry-

- Less expensive
- faster



ROS1 rearrangement in NSCLC

- Found in 1% on Adenocarcinomas of the lung
- Younger patients, non-smokers
- Diagnosed with IHC (and FISH break-apart)
- No data on the risk of thromboembolic events, but clinical observations suggest increased risk

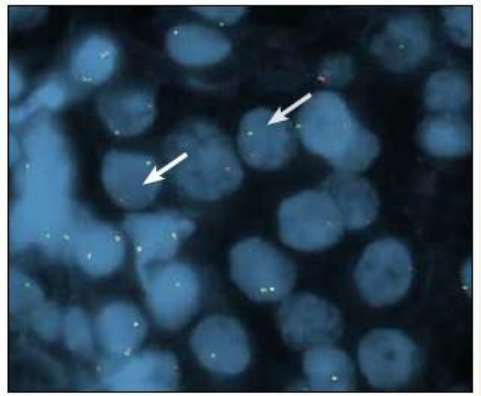


Figure 3. *ROS1* gene rearrangement in lung adenocarcinoma using a break-apart FISH assay, characterized by separation of red and green probes for *ROS1* gene in the tumor cells

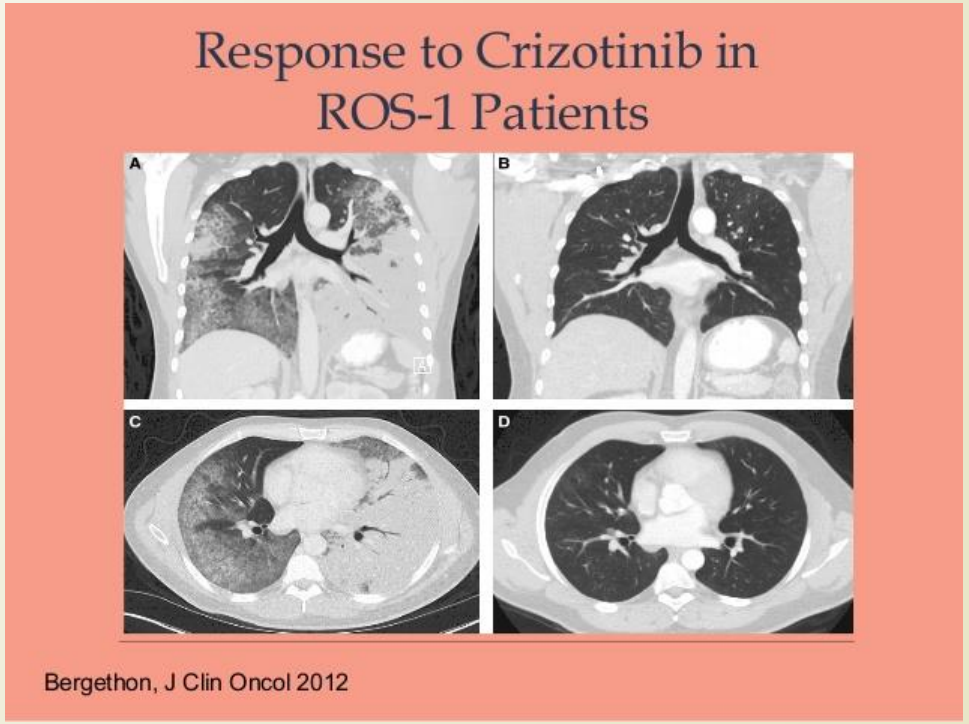


When diagnosing ALK rearrangement…

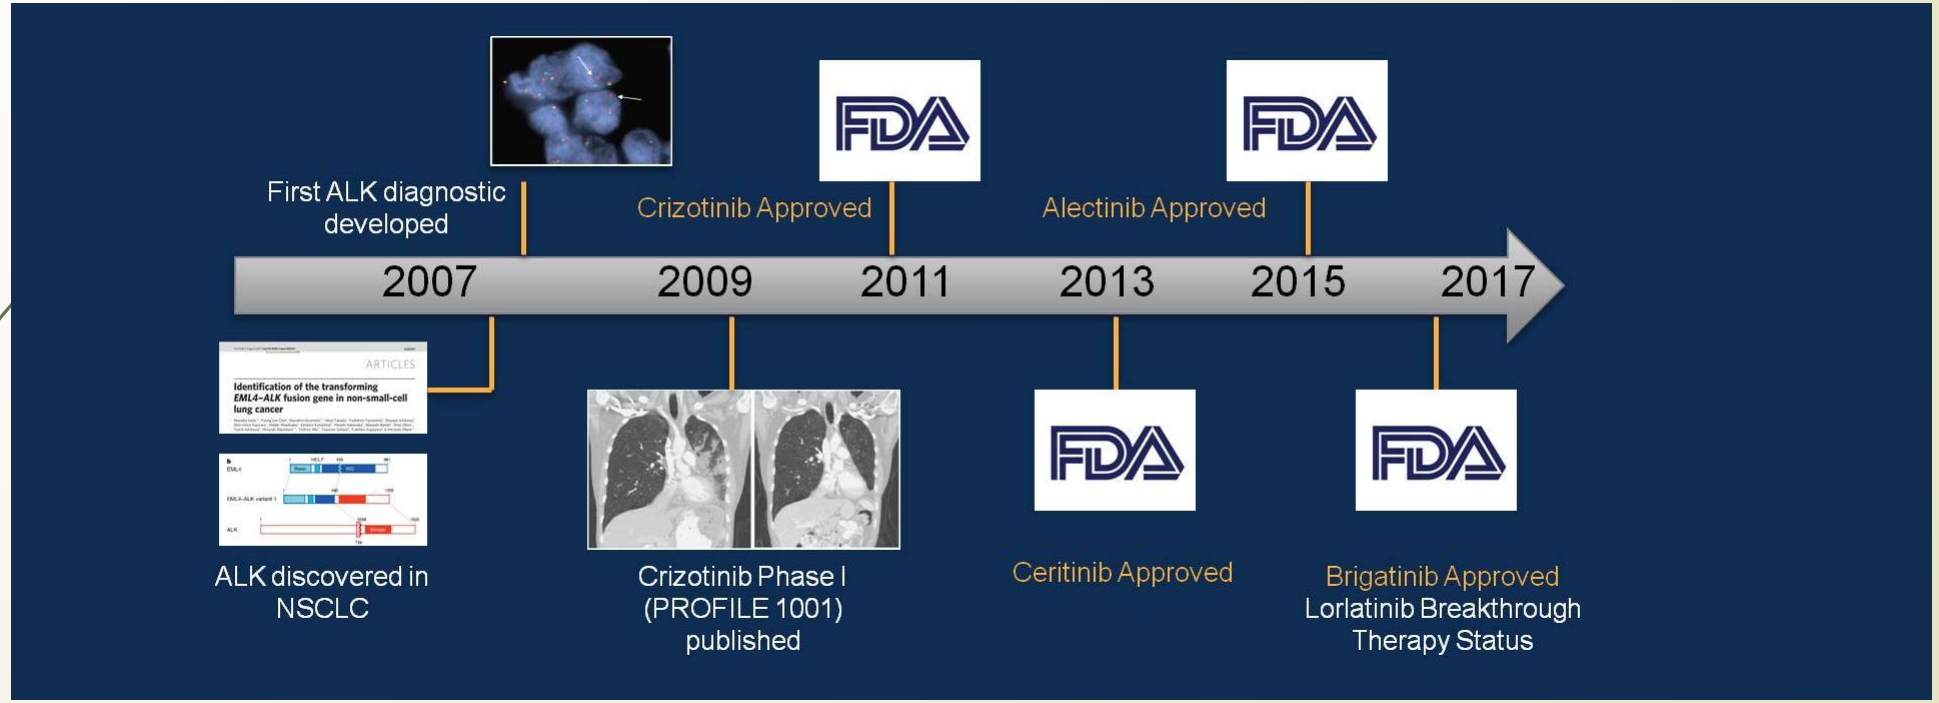
Why?

Because there are so many treatment options…and significant OS benefit

Lorlatinib, Ensartinib and many more in clinical trials…

How did it all start?

Treatment for ALK +ive NSCLC- the most rapid clinical translation!



Crizotinib is the 1st drug approved for ALK-rearrangement based on phase I trial

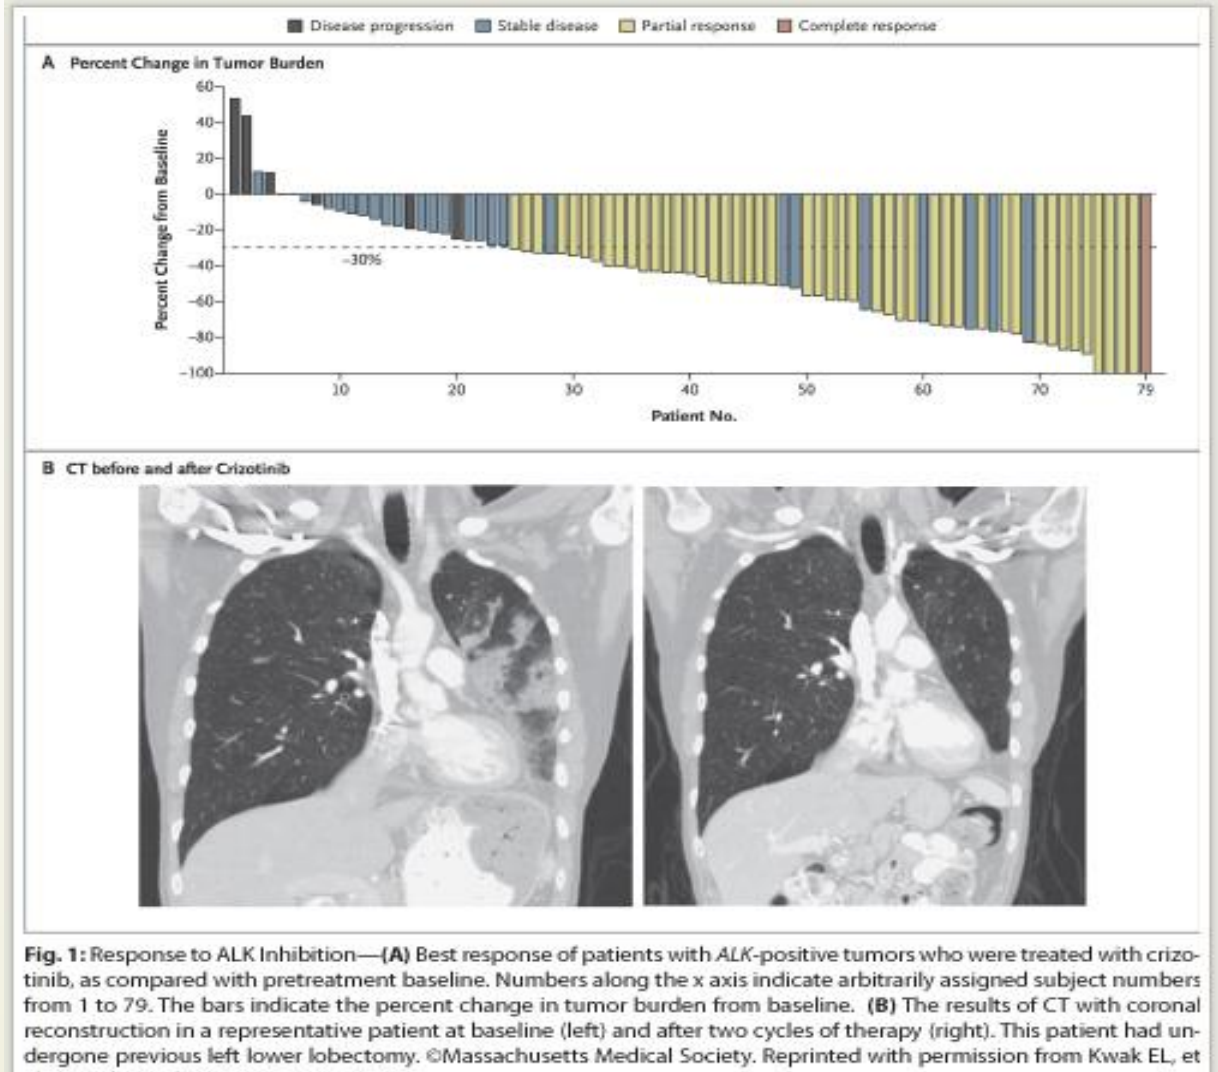


Fig. 1: Response to ALK Inhibition—**(A)** Best response of patients with *ALK*-positive tumors who were treated with crizotinib, as compared with pretreatment baseline. Numbers along the x axis indicate arbitrarily assigned subject numbers from 1 to 79. The bars indicate the percent change in tumor burden from baseline. **(B)** The results of CT with coronal reconstruction in a representative patient at baseline (left) and after two cycles of therapy (right). This patient had undergone previous left lower lobectomy. ©Massachusetts Medical Society. Reprinted with permission from Kwak EL, et

Side effects

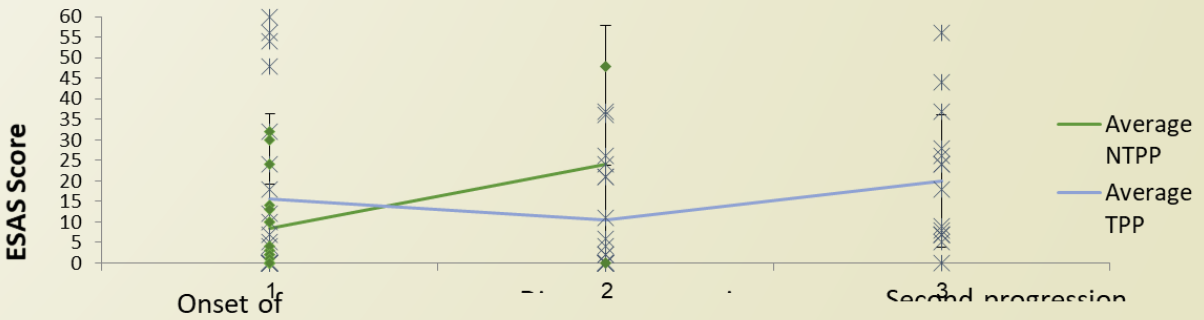
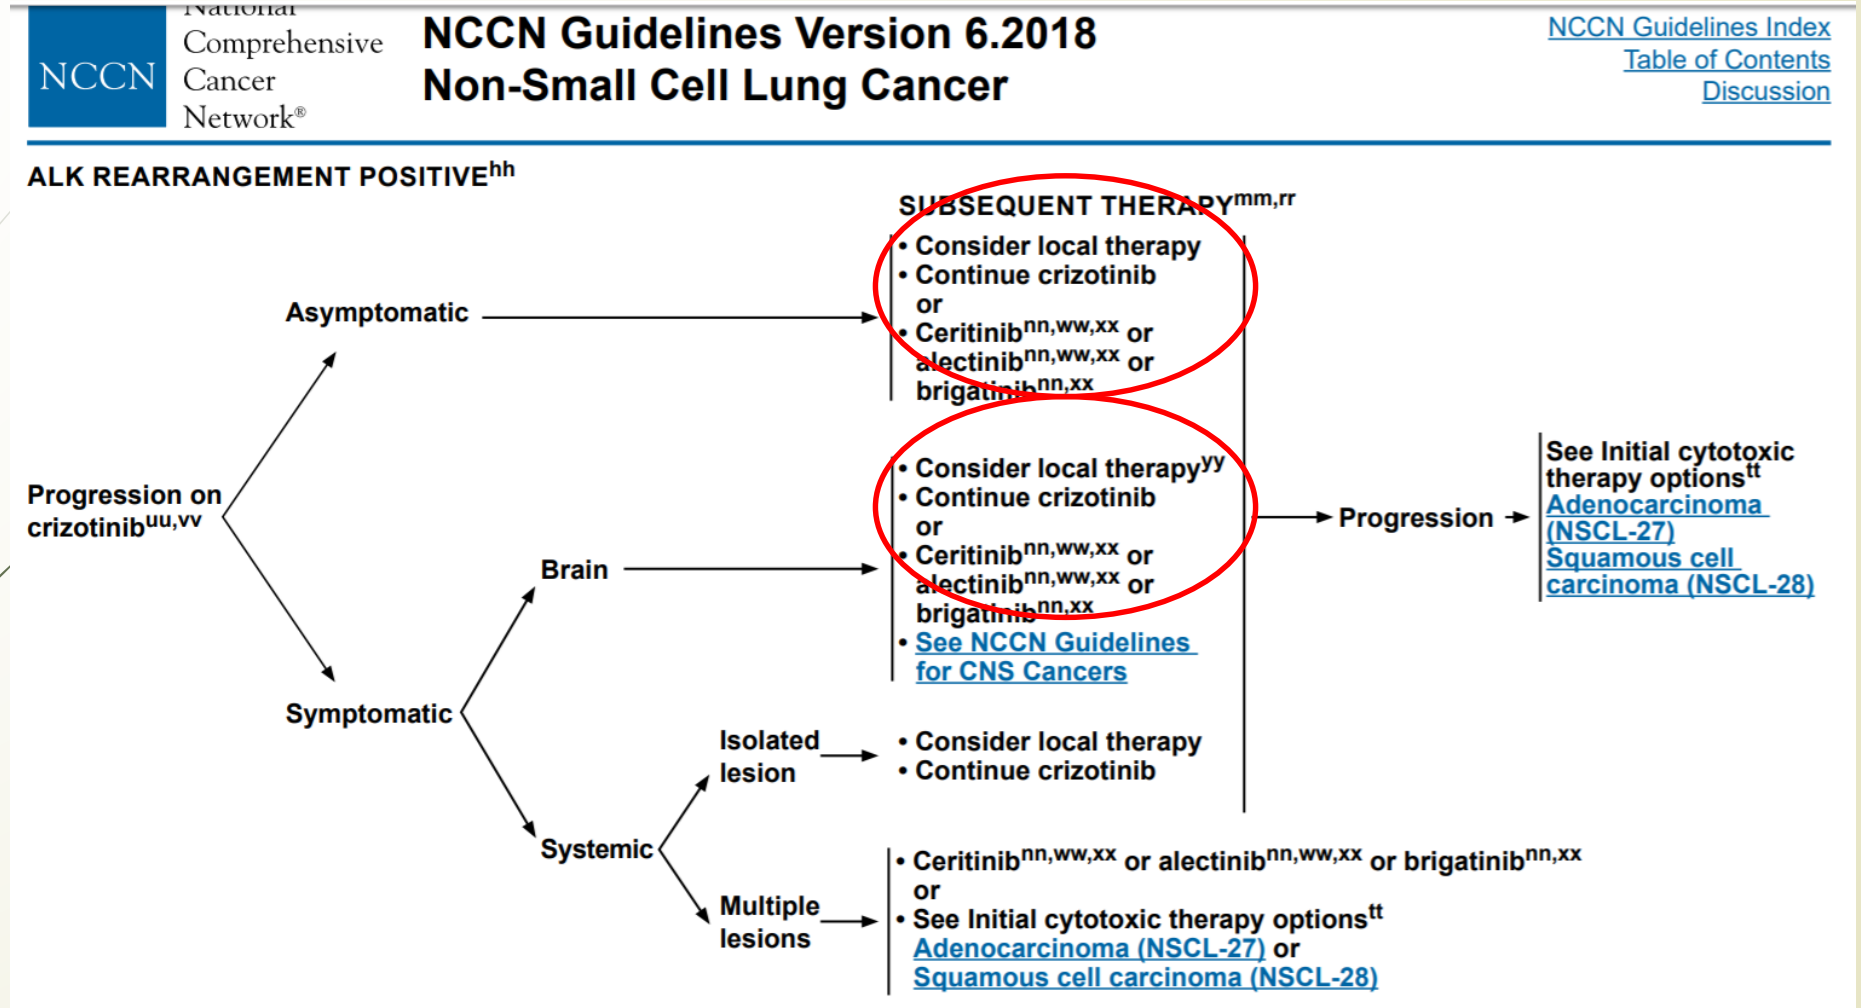
Mean symptom burden during treatment with ALK inhibitors

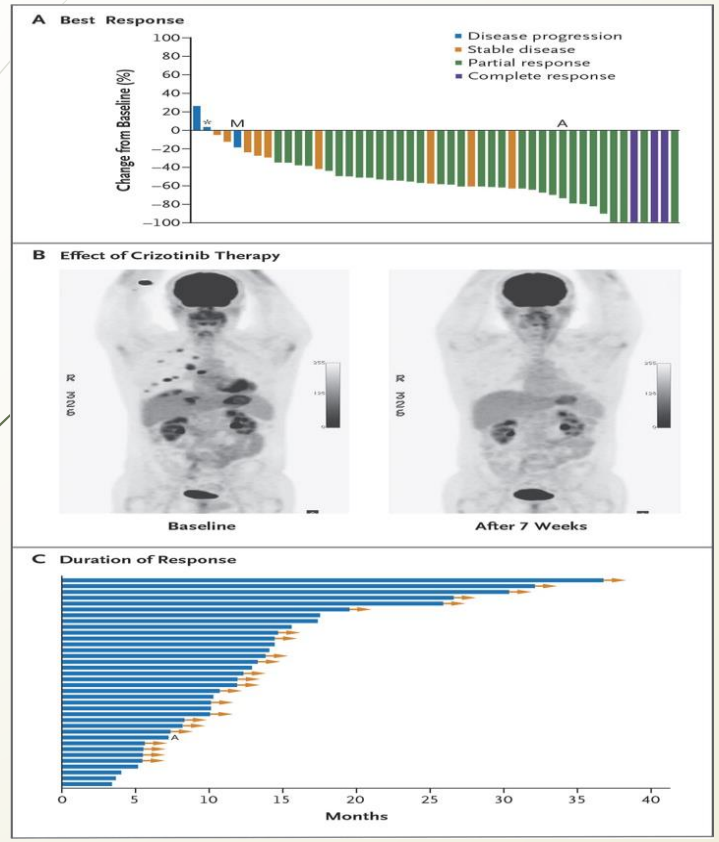


Treatment beyond disease progression: ALK inhibitors in *ALK*-rearranged advanced NSCLC
Mor Moskovitz, Priscilla Matthews, Alexandra Pavel, Dongyang Yang, Brendon Morganstein, Wei Xu, Penelope Bradbury, Geoffrey Liu, Frances Shepherd, Natasha B. Leighl Annals of Oncology 28.suppl_5 (2017).

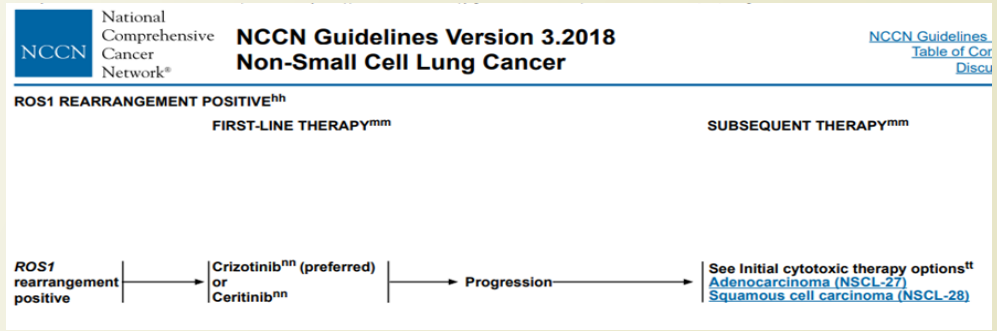


The NCCN suggest consider treatment past progression!

Tumor Responses to Crizotinib in *ROS1*-Rearranged Non–Small-Cell Lung Cancer.

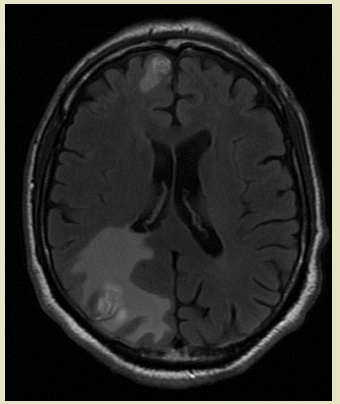


Shaw AT et al. N Engl J Med 2014;371:1963-1971.



The CNS- A sanctuary site

- 30-40% of ALK rearranged patients have brain mets at initial diagnosis.
- CNS is one of the most common sites of relapse on Crizotinib- first site of disease progression in 46% of patients!
- Among ALK rearranged patients entering trials with next-generation ALK TKIs, rates of CNS mets approaching 60%
- Brain metastases impact quality of life



What did we do with brain metastases in the past?

- Radiotherapy- whole brain, stereotactic radiotherapy
- Changing crizotinib schedule

CASE REPORT

Effective Crizotinib Schedule for Brain Metastases in ALK Rearrangement Metastatic Non–Small-Cell Lung Cancer

Nir Peled, MD, PhD, Leor Zach, MD,† Ori Liran, MSc,* Maya Ilouze, PhD,* Paul A. Bunn Jr., MD,‡ and Fred R. Hirsch, MD, PhD‡*

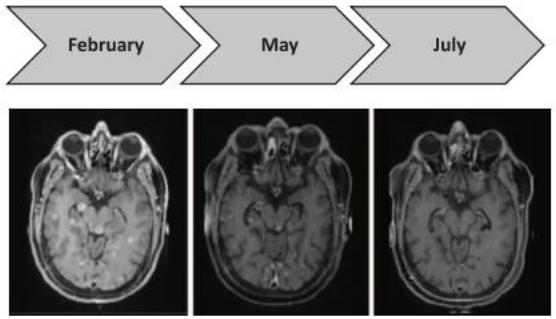


FIGURE 1. Brain MRIs (axial t1 with contrast images) in February, May, and July 2013. Brain metastases were diagnosed after 20 months of crizotinib therapy (250 mg twice daily). Whole-brain radiotherapy (3000 cGy/10fr) was administered while crizotinib was continued in standard dose (except for the radiation period). Follow-up MRI (May 2013) showed lack of response. Then, crizotinib was rescheduled for 500 mg X1/day, with a dramatic response 2 months later. MRI, magnetic resonance imaging.

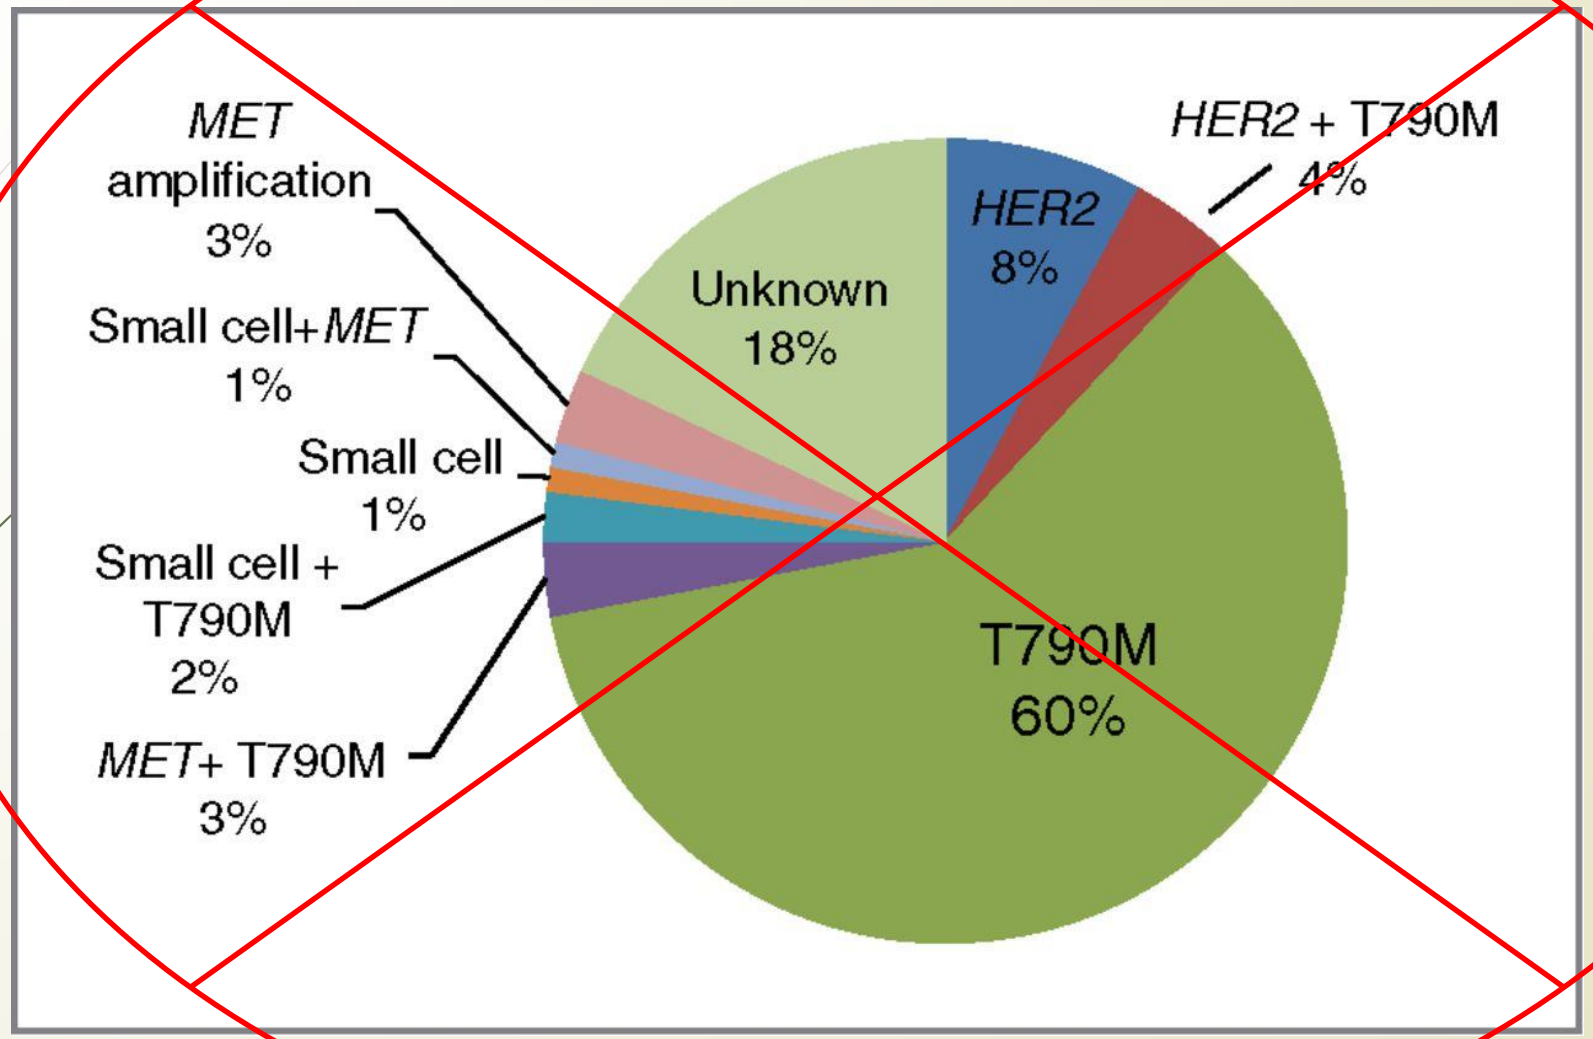
Resistance pathways to EGFR TKI



Not so easy with ALK…

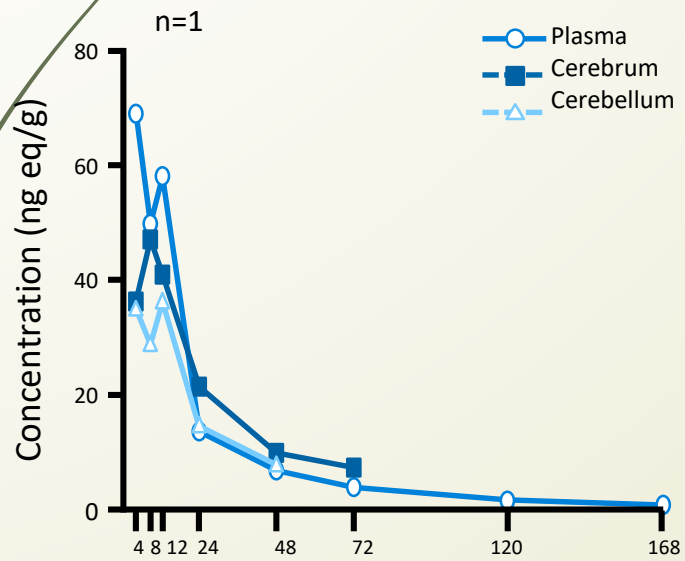
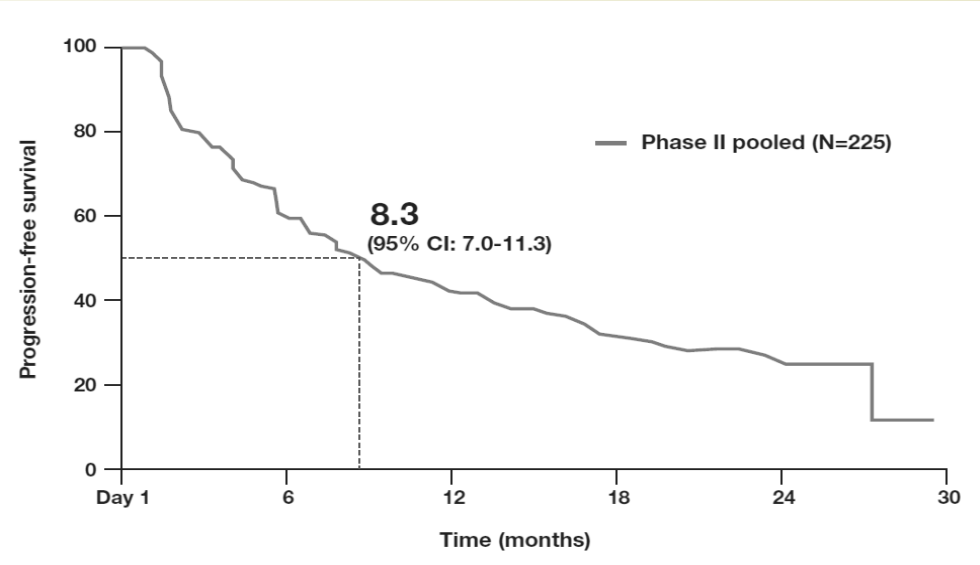
CNS: First Place of Progression in 46% of 1L Patients

Alectinib is not a substrate for the drug efflux transporter P-gp3, and is therefore not actively transported out of the brain[1]

^{14}C-labelled Alectinib administration shows similar CSF and Plasma Concentration[1]



Alectinib is clinically active in the CNS irrespective of prior radiation[2]

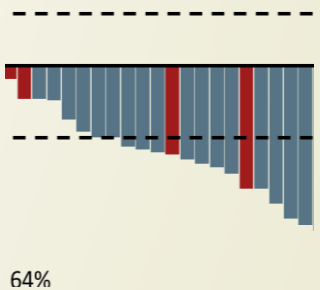


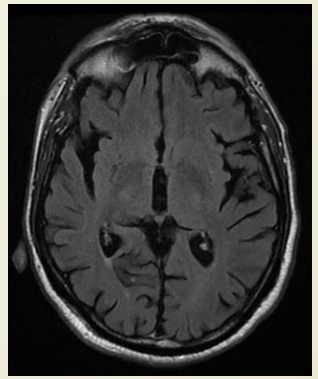
. Gadgeel, et al. J Clin Oncol 20162. Kodama, et al. Cancer Chemother Pharmacol 2014 , 1

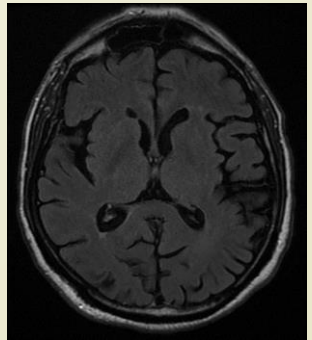
Patient case

- 76 y male, diagnosed 10/2015 with NSCLC Adenocarcinoma, stage IIIA
- Resection and adjuvant chemo-radio
- 06/2017- metastases in brain and lymph nodes
- Treated with Crizotinib with good systemic response, stable CNS disease
- 11/2017- PD in brain
- 12/2017- started Alectinib

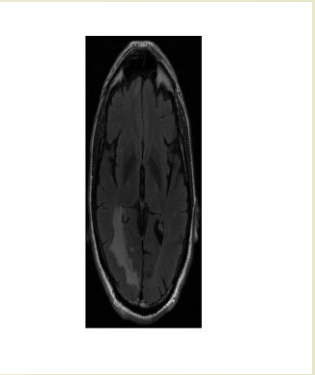
November 2017

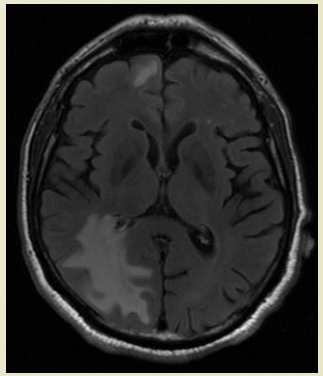


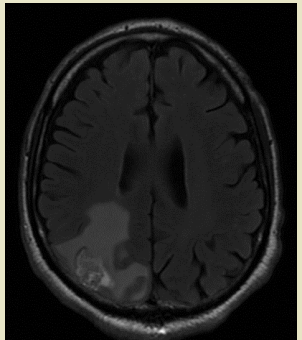




February 2018





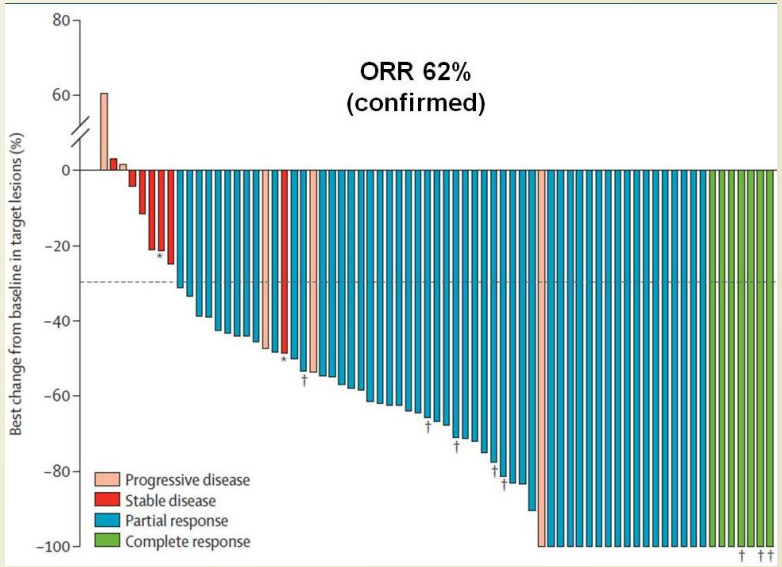


Brigatinib-next generation ALK inhibitor

Mechanism of Action

- Brigatinib is a tyrosine kinase inhibitor with in vitro activity against multiple kinases including ALK, ROS1, insulin-like growth factor-1 receptor (IGF-IR), and FLT-3, as well as EGFR deletion and point mutations
- It inhibits autophosphorlylation of ALK and ALK-mediated phosphorylation of downstream signaling proteins STAT3, AKT, ERK1/2, and S6
- It is also inhibits in vitro proliferation of cell lines expressing EML4-ALK and NPM-ALK fusion proteins

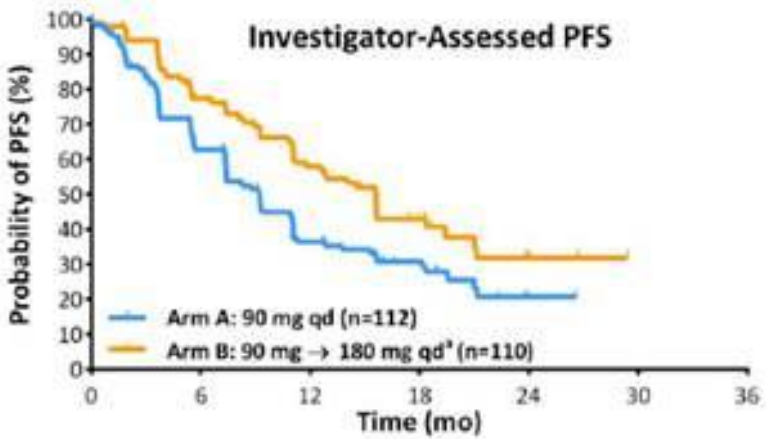
Phase I

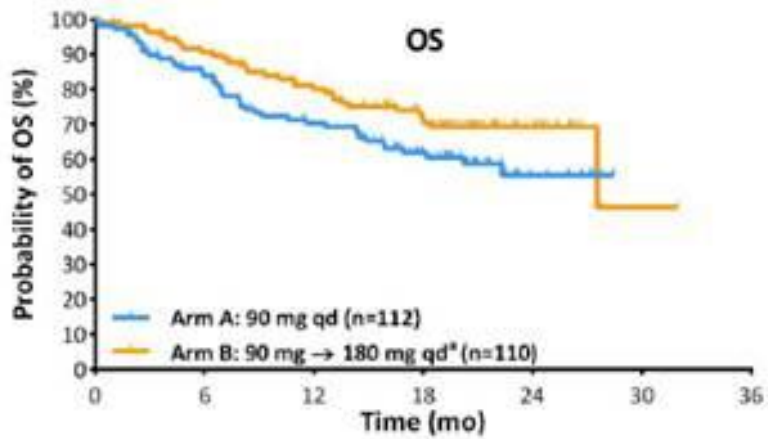


Brigatinib- efficacy and safety in the 2nd line

Randomised phase II- ALTAtrial

Survival in Crizotinib-Resistant Patients





Treatment	Median PFS (95% CI)	HR (95% CI)
Arm A: 90 mg qd (% events = 65)	9.2 months (7.4–11.1)	0.64 (0.45–0.91)
Arm B: 90 mg → 180 mg qd[a] (% events = 50)	15.6 months (11.1–19.4)	

Treatment	Median OS (95% CI)	HR (95% CI)
Arm A: 90 mg qd (% events = 38)	NR (20.2–NR)	0.67 (0.42–1.06)
Arm B: 90 mg → 180 mg qd[a] (% events = 29)	27.6 months (27.6–NR)	

[a] 180 mg qd with 7-day lead-in at 90 mg. HR, hazard ratio; NR, not reached; qd, once daily

- IRC-assessed median PFS was 9.2 months (95% CI, 7.4–12.8 months) in Arm A and 16.7 months (95% CI, 11.6–NR months) in Arm B

Mechanism of Action

- Brigatinib is a tyrosine kinase inhibitor with in vitro activity against multiple kinases including ALK, ROS1, insulin-like growth factor-1 receptor (IGF-1R), and FLT-3, as well as EGFR deletion and point mutations
- It inhibits autophosphorylation of ALK and ALK-mediated phosphorylation of downstream signaling proteins STAT-3, AKT, ERK1/2, and S6
- It is also inhibits in vitro proliferation of cell lines expressing EML4-ALK and NPM-ALK fusion proteins

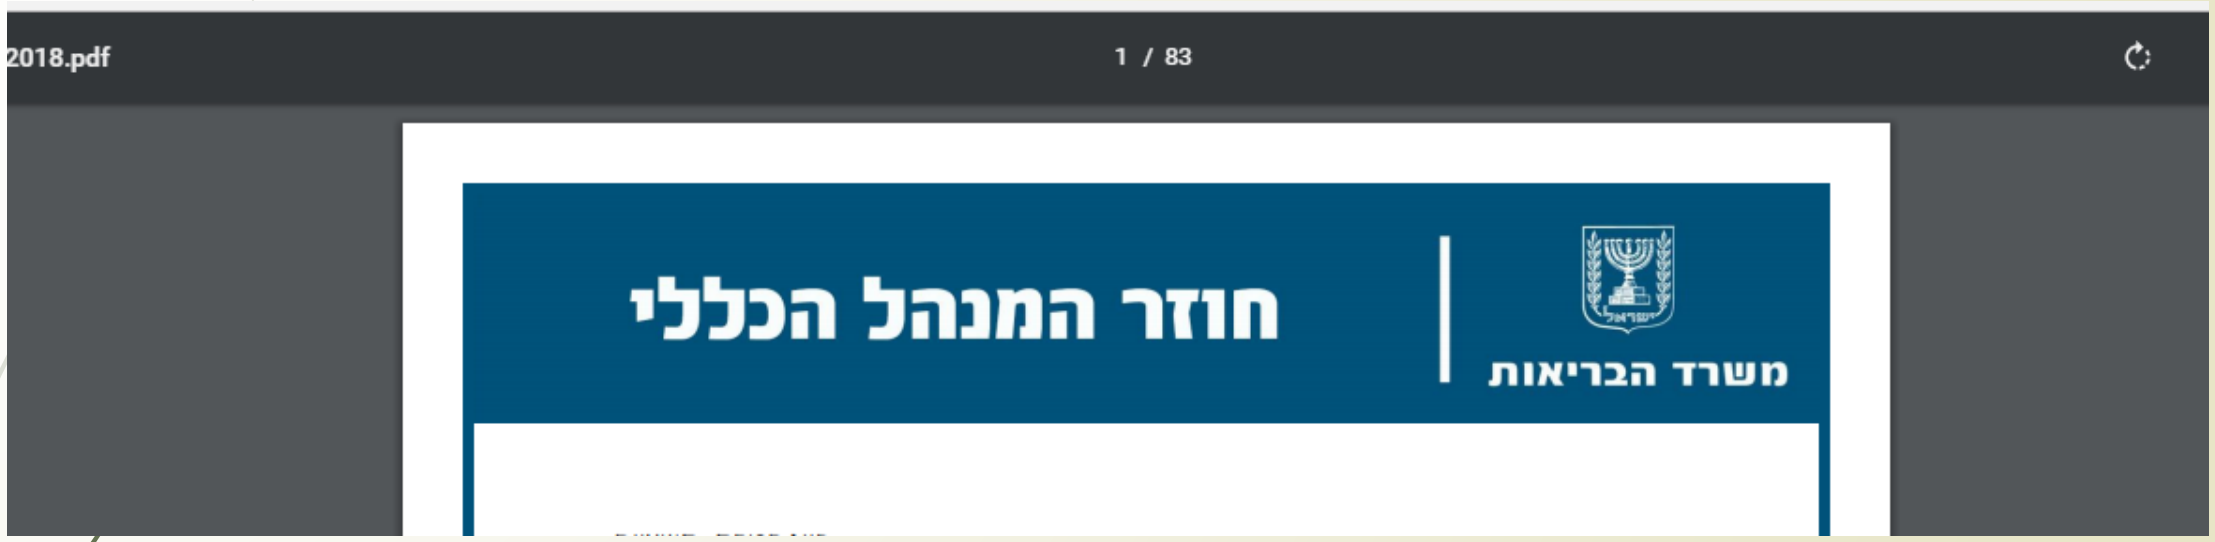
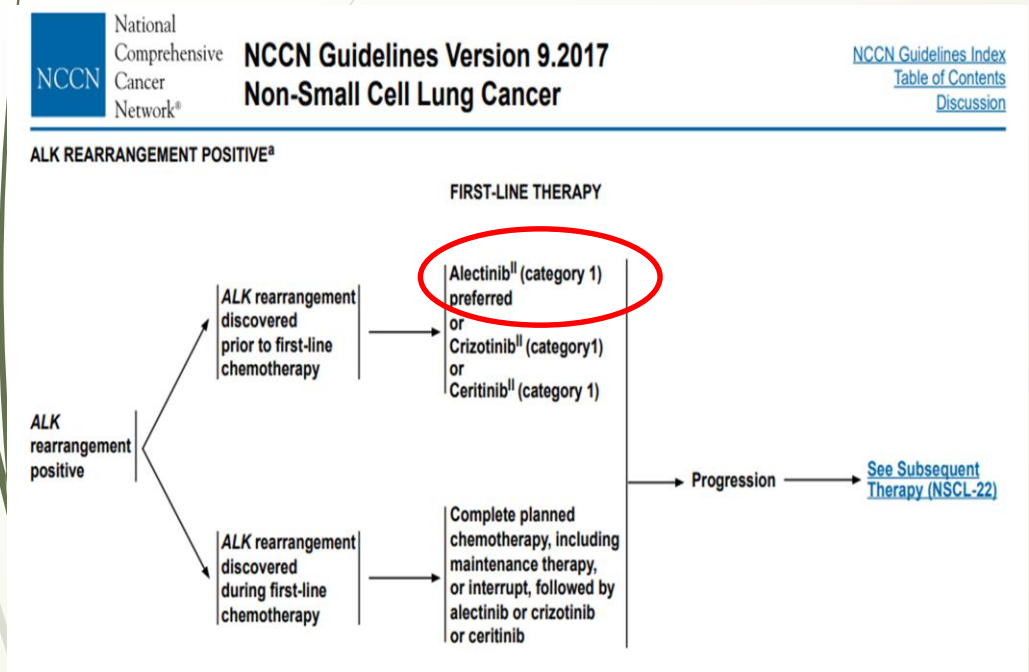
Whats next? To be presented at WCLC 2018

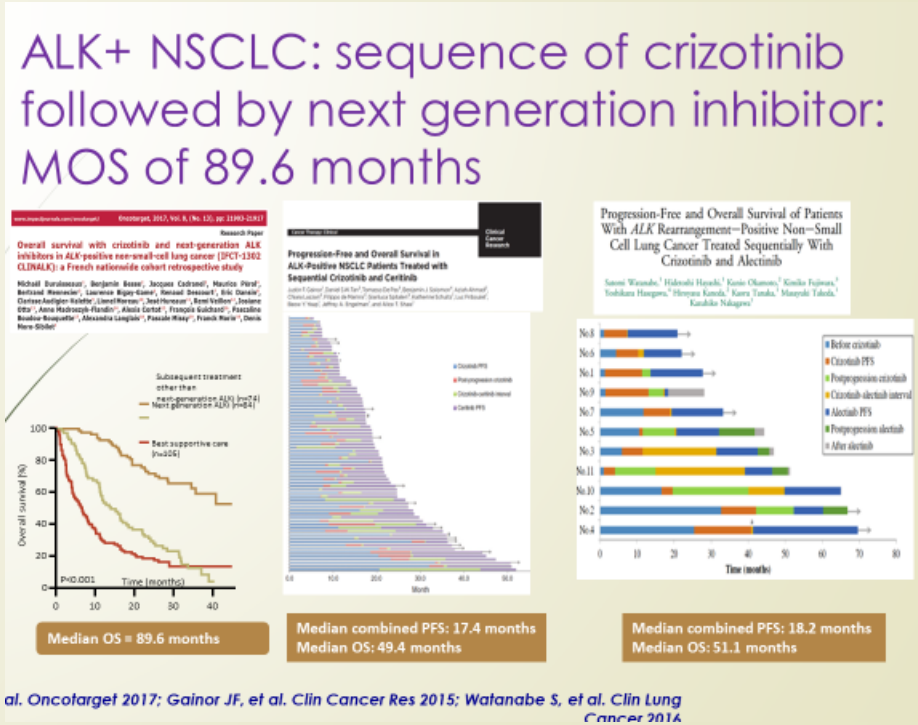


טיפול בפגיעה בראיה על רקע DME (בצקת מקולרית סוכרתית) כקו טיפול מתקדם אחרי Bevacizumab (במהלך	Eylea	Aflibercept

The choice of 1st line ALK- evidence based sequence or go with the best drug first?



Or



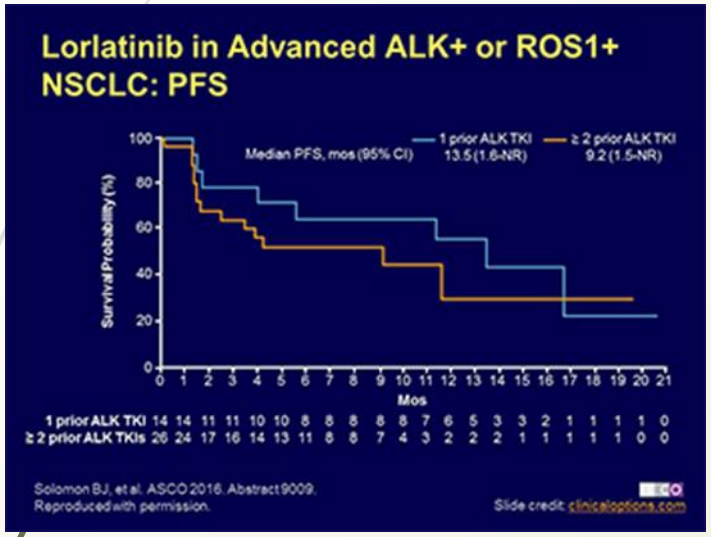
My index case

- 40 year old lady, healthy, never smoker
- 2013- Diagnosed with NSCLC, adenocarcinoma, mets to lung, bone, lymph nodes, EGFR and ALK pending
- Started chemotherapy- carboplatin and paclitaxel
- ALK positive!
- Started crizotinib after 4 cycles of chemo
- Complete response!

- 8 months later- dizziness, headache
- Diagnosed with multiple brain metastases
- Started whole brain radiotherapy
- Continue with crizotinib? Change to other ALK?

- After WB, the patient continued crizotinib
- PD in brain, with hydrocephalus
- Deceased 2 months after diagnosis of brain metastases
- Sometimes we only have 1 chance!

How about ROS1? Not much debate here yet…



- Of the 12 patients with *ROS1* -positive NSCLC, six (50%) achieved a confirmed partial response and two (17%) had stable disease
- Two patients had received previous crizotinib, and the other four patients were crizotinib naive but had received platinum doublet chemotherapy.
- Median duration of response was 12·0 months (95% CI 5·7–NR).
- Brigatinib, cabozantinib, enteractinib in advanced line of treatment show efficacy (very little evidence)
- Our experience shows prolonged survival with crizotinib- and 1 patient on the lorlatinib access program survived 4 years.

Lorlatinib in non-small-cell lung cancer with *ALK* or *ROS1* rearrangement: an international, multicentre, open-label, single-arm first-in-man phase 1 trial Shaw, Alice T et al. The Lancet Oncology , Volume 18 , Issue 12 , 1590 - 1599

Summary- treatment of ALK +ive NSCLC

- ALK and ROS1rearrangement- mainly in non smokers with Adenocarcinoma
- Diagnosed mainly by IHC
- Crizotinib was the first ALK inhibitor- showed efficacy in 1st line with median OS of 5-7 years
- Alectinib-preferred drug for ALK in 1st line
- Alectinib, Ceritinib, Brigatinib demonstrated efficacy in 2nd line post crizotinib- no definite sequence yet-, but real world and prospective evidence are on the way…

Thank you!
